

M2i.49xx - 8 channel 16 bit A/D up to 60 MS/s

- 2, 4 or 8 channels with 10 MS/s up to 60 MS/s
- Software selectable single-ended or differential inputs
- Simultaneously sampling on all channels
- Additional digital inputs as option available
- Separate ADC and amplifier per channel
- complete on-board calibration
- 6 input ranges: ±200 mV up to ±10 V
- Up to 1 GSample on-board memory
- 256 MSample standard on-board memory
- Programmable input offset of ±100%
- Window, pulse width, re-arm, spike, OR/AND trigger
- Synchronization of up to 16 cards per system and up to 271 cards with system sync
- Features: Streaming, ABA mode, Multiple Recording, Gated Sampling

- 66 MHz 32 bit PCI-X interface
- 5V / 3.3V PCI compatible
- 100% compatible to conventional PCI > V2.1
- Sustained streaming mode up to 245 MB/s
- 2,5 GBit x1 PCle Interface
- Works with x1/x4/x8/x16* PCle slots
- Software compatible to PCI
- Sustained streaming mode up to 160 MB/s

Operating Systems

- Windows 7 (SP1), 8, 10, Server 2008 R2 and newer
- Linux Kernel 2.6, 3.x, 4.x, 5.x
- Windows/Linux 32 and 64 bit

Recommended Software

- Visual C++, Delphi, C++ Builder, GNU C++, VB.NET, C#, J#, Java, Python
- SBench 6

Drivers

- MATLAB
- LabVIEW
- LabWindows/CVI

General Information

The M2i.49xx series allows recording of up to eight channels with sampling rates of 30 MS/s or four channels with sampling rates of 60 MS/s. These cards offer outstanding A/D features both in resolution and speed for PCI/PCI-X and PCI Express. The cards can be switched between Single-Ended inputs with a programmable offset and true differential inputs. If used in differential mode each two inputs are connected together reducing the number of available channels by half.

The 16 bit vertical resolution have four times the accuracy compared to 14 bit cards and sixteen times the accuracy if compared with a 12 bit card. All boards of the M2i.49xx series may use the whole installed on-board memory of up to 1 GSamples, completely for the currently activated number of channels.

*Some x16 PCIe slots are for the use of graphic cards only and can not be used for other cards.

Software Support

Windows drivers

The cards are delivered with drivers for Windows 7, Windows 8 and Windows 10 (32 bit and 64 bit). Programming examples for Visual C++, C++ Builder, Delphi, Visual Basic, VB.NET, C#, J#, Python, Java and IVI are included.

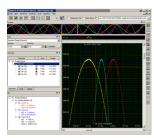

Linux Drivers

All cards are delivered with full Linux support. Pre compiled kernel modules are included for the most common distributions like Fedora, Suse, Ubuntu LTS or Debian. The Linux support includes SMP systems, 32 bit and 64 bit systems, versatile programming examples for GNU C++,

Python as well as the possibility to get the driver sources for your own compilation.

SBench 6

A base license of SBench 6, the easy-to-use graphical operating software for Spectrum cards, is included in the delivery. The base license makes it is possible to test the card, display acquired data and make some basic measurements. It's a valuable tool for checking the card's performance and assisting with the unit's initial

setup. The cards also come with a demo license for the SBench 6 professional version. This license gives the user the opportunity to test the additional features of the professional version with their hardware. The professional version contains several advanced measurement functions, such as FFTs and X/Y display, import and export utilities as well as support for all acquisition modes including data streaming. Data streaming allows the cards to continuously acquire data and transfer it directly to the PC RAM or hard disk. SBench 6 has been optimized to handle data files of several GBytes. SBench 6 runs under Windows as well as Linux (KDE, GNOME and Unity) operating systems. A test version of SBench 6 can be downloaded directly over the internet and can run the professional version in a simulation mode without any hardware installed. Existing customers can also request a demo license for the professional version from Spectrum. More details on SBench 6 can be found in the SBench 6 data sheet.

Third-party Software Products

Most popular third-party software products, such as LabVIEW, MATLAB or LabWindows/CVI are supported. All drivers come with examples and detailed documentation.

Hardware features and options

PCI/PCI-X

The cards with PCI/PCI-X bus connector use 32 Bit and up to 66 MHz clock rate for data transfer. They are 100% compatible to Conventional PCI > V2.1. The universal interface allows the use in PCI slots with 5 V I/O and 3.3 V I/O voltages as well as in PCI-

 $\rm X$ or PCI 64 slots. The maximum sustained data transfer rate is 245 MByte/s per bus segment.

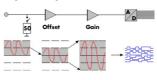

PCI Express

The cards with PCI Express use a x1 PCIe connector. They can be used in PCI Express x1/x4/x8/x16 slots, except special graphic card slots, and are 100% software compatible to Conventional PCI > V2.1. The maximum sustained data transfer rate is

160 MByte/s per slot.

Input Amplifier

The analog inputs can be adapted to real world signals using a wide variety of settings that are individual for each channel. By using software commands the input termination can be changed

between 50 Ohm and 1 MOhm, one can select a matching input range and the signal offset can be compensated for.

Differential inputs

With a simple software command the inputs can individually be switched from single-ended (in relation to ground) to differential by combining each two single-ended inputs to one differential input. When the inputs are used in differential mode the A/D converter measures the difference between two lines with relation to system ground.

Automatic on-board calibration

All of the channels are calibrated in factory before the board is shipped. To compensate for different variations like PC power supply, temperature and aging, the software driver provides routines for an automatic onboard offset and gain calibration of all input ranges. All the cards contain a high precision on-board calibration reference.

Digital inputs

This option acquires additional synchronous digital channels phase-stable with the analog data. When the option is installed there are 16 additional digital in-

puts on 4 channel A/D instruments and 32 digital inputs on A/D instruments with 8 and more channels.

The digital inputs can be mulitplexed into the analog data by software command using many different formats:

- Each 16 digital inputs can replace one analog channel.
- Each 2 digital inputs can be multiplexed into an analog channel with a resolution reduced to 14 bit.
- Each 4 digital inputs can be multiplexed into an analog channel with a resolution reduced to 12 bit.

Ring buffer mode

The ring buffer mode is the standard mode of all oscilloscope instruments. Digitized data is continuously written into a ring memory until a

trigger event is detected. After the trigger, post-trigger samples are recorded and pre-trigger samples can also be stored. The number of pre-trigger samples available simply equals the total ring memory size minus the number of post trigger samples.

FIFO mode

The FIFO mode is designed for continuous data transfer between measurement board and PC memory (up to 245 MB/s on a PCI-X slot, up to 125 MB/s on a PCI slot and up to 160 MB/s on a PCIe

slot) or hard disk. The control of the data stream is done automatically by the driver on interrupt request. The complete installed onboard memory is used for buffer data, making the continuous streaming extremely reliable.

Channel trigger

The data acquisition instruments offer a wide variety of trigger modes. Besides the standard signal checking for level and edge as known from oscilloscopes it's also possible to define a window trigger. All trigger modes can be combined with the pulsewidth trigger. This makes it possible to trigger on signal errors like too long or too short pulses. In addition to this a re-arming mode (for accurate trigger recognition on noisy signals) the AND/OR conjunction of different trigger events is possible. As a unique feature it is possible to use deactivated channels as trigger sources.

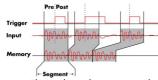

External trigger I/O

All instruments can be triggered using an external TTL signal. It's possible to use positive or negative edge also in combination with a programmable pulse width. An internally recognised trigger event can - when activated by software - be routed to the trigger connector to start external instruments.

Pulse width

Defines the minimum or maximum width that a trigger pulse must have to generate a trigger event. Pulse width can be combined with channel trigger, pattern trigger and external trigger.

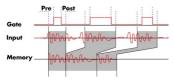

Multiple Recording

The Multiple Recording mode allows the recording of several trigger events with an extremely short re-arming time. The hardware doesn't need to be restarted in be-

tween. The on-board memory is divided in several segments of the same size. Each of them is filled with data if a trigger event occurs. Pre- and posttrigger of the segments can be programmed. The number of acquired segments is only limited by the used memory and is unlimited when using FIFO mode.

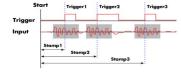

Gated Sampling

The Gated Sampling mode allows data recording controlled by an external gate signal. Data is only recorded if the gate signal has a programmed level. In addition a pre-area before start

of the gate signal as well as a post area after end of the gate signal can be acquired. The number of gate segments is only limited by the used memory and is unlimited when using FIFO mode.

Timestamp

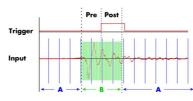

The timestamp function writes the time positions of the trigger events in an extra memory. The timestamps are relative to the start of recording, a defined zero time, ex-

ternally synchronized to a radio clock, an IRIG-B a GPS receiver. Using the external synchronization gives a precise time relation for acquisitions of systems on different locations.

External clock output

Using a dedicated connector it is possible to output the internally used sampling clock to synchronize external equipment to this clock

ABA mode

The ABA mode combines slow continuous data recording with fast acquisition on trigger events. The ABA mode works like a slow data logger combined with a fast digitizer. The exact

position of the trigger events is stored as timestamps in an extra memory.

Reference clock

The option to use a precise external reference clock (normally 10 MHz) is necessary to synchronize the instrument for high-quality

measurements with external equipment (like a signal source). It's also possible to enhance the quality of the sampling clock in this way. The driver automatically generates the requested sampling clock from the fed in reference clock.

Star-Hub

The star-hub is an additional module allowing the phase stable synchronisation of up to 16 boards in one system. Independent of the number of boards there is no phase delay between all channels. The starhub distributes trigger and

clock information between all boards. As a result all connected boards are running with the same clock and the same trigger. All trigger sources can be combined with OR/AND allowing all channels of all cards to be trigger source at the same time. The star-hub is available as 5 card and 16 card version. The 5 card version doesn't need an extra slot.

271 synchronous cards with the System Star-Hub

With the help of multiple system star-hubs it is possible to link up to 17 system phase synchronous with each oth-

er. Each system can then contain up to 16 cards (master only 15). In total 271 cards can be used fully synchronously in a bunch of systems. One master system distributes clock and trigger signal to all connected slave systems.

BaseXIO (Asynchronous I/O, enhanced trigger)

The BaseXIO option offers 8 asynchronous digital I/O lines on the base card. The direction can be selected by software in groups of four. This allows e.g. external equipment control or status monitor-

ing. Two of these lines can also be used as additional external trigger sources. This allows the building of complex trigger conjunctions with external gated triggers as well as AND/OR conjunction of multiple external trigger sources like, for example, the picture and row synchronisation of video signals. In addition one of the I/O lines can be used as reference clock for the Timestamp counter.

Technical Data

Analog Inputs

Resolution 16 bit (can be reduced to acquire simultaneous digital inputs)

Input Range software programmable ±200 mV, ±500 mV, ±1 V, ±2 V, ±5 V, ±10 V

Input Type software programmable Sinale-ended or True Differential

Input Offset (single-ended) software programmable programmable to $\pm 100\%$ of input range in steps of 1%

ADC Differential non linearity (DNL) ADC only 491x + 493x: ±1.2 LSB; 496x: ±1.4 LSB 491x + 493x: ±5.5 LSB; 496x: ±6.5 LSB ADC Integral non linearity (INL) ADC only

Offset error (full speed) after warm-up and calibration ≤ 0.1% Gain error (full speed) < 0.1% after warm-up and calibration

Crosstalk: Signal ≤ 1 MHz, 50 ohm $range \leq \pm 1V$ ≤ 100 dB on adjacent channels (all card types)

≤ 58 dB on adjacent channels (M2i.491x, M2i.493x, M2i.4963, M2i.4964) Crosstalk: Signal ≤ 1 MHz, 50 ohm $range \geq \pm 2V$

Crosstalk: Signal ≤ 1 MHz, 50 ohm range $\ge \pm 2V$ ≤ 80 dB on adjacent channels (M2i.4960, M2i.4961)

50 Ohm / 1 MOhm | | TBD pF Analog Input impedance software programmable

Analog input coupling fixed DC ±5 V Over voltage protection $range \leq \pm 1V$ ±40 V Over voltage protection $range \geq \pm 2V$

CMRR (Common Mode Rejection Ratio) range $\leq \pm 1V$ 100 kHz: 80 dB, 1 MHz: 59 dB, 10 MHz: 41 dB CMRR (Common Mode Rejection Ratio) 100 kHz: 59 dB. 1 MHz: 53 dB. 10 MHz: 52 dB $range \geq \pm 2V$ Channel selection (single-ended inputs) software programmable 1, 2, 4 or 8 channels (maximum is model dependent) Channel selection (true differential inputs) software programmable 1, 2 or 4 channels (maximum is model dependent)

<u>Triager</u>

Available trigger modes Channel Trigger, External, Software, Window, Pulse, Re-Arm, Spike, Or/And, Delay software programmable

Trigger level resolution software programmable

Trigger edge software programmable Rising edge, falling edge or both edges Trigger pulse width software programmable 0 to [64k - 1] samples in steps of 1 sample Trigger delay software programmable 0 to [64k - 1] samples in steps of 1 sample Multi, Gate: re-arming time < 4 samples (+ programmed pretrigger)

Pretrigger at Multi, ABA, Gate, FIFO software programmable 4 up to [8176 Samples / number of active channels] in steps of 4 $\,$

software programmable 4 up to [8G - 4] samples in steps of 4 (defining pretrigger in standard scope mode) Posttrigger Memory depth software programmable 8 up to [installed memory / number of active channels] samples in steps of 4 Multiple Recording/ABA segment size software programmable 8 up to [installed memory / 2 / active channels] samples in steps of 4

Trigger output delay One positive edge after internal trigger event

Internal/External trigger accuracy 1 sample

External trigger type (input and output) 3.3V LVTTL compatible (5V tolerant with base card hardware version > V20)

External trigger input Low \leq 0.8 V, High \geq 2.0 V, \geq 8 ns in pulse stretch mode, \geq 2 clock periods all other modes

-0.5 V up to +5.7 V (internally clamped to 5.0V, 100 mA max. clamping current) External trigger maximum voltage

Trigger impedance software programmable 50 Ohm / high impedance (> 4kOhm)

External trigger output type 3 3 V IVTTI

Low ≤ 0.4 V, High ≥ 2.4 V, TTL compatible External trigger output levels

External trigger output drive strength Capable of driving 50 ohm load, maximum drive strength ±128 mA

Clock

Clock Modes software programmable internal PLL, internal quartz, external reference clock, sync

Internal clock range (PLL mode) 1 kS/s to max using internal reference, 50kS/s to max using external reference clock software programmable Internal clock accuracy ≤ 20 ppm

 \leq 1% of range (100M, 10M, 1M, 100k,...): Examples: range 1M to 10M: stepsize \leq 100k Internal clock setup granularity External reference clock range software programmable \geq 1.0 MHz and \leq 125.0 MHz

External reference clock impedance software programmable 50 Ohm / high impedance (> 4kOhm) External reference clock range see "Dynamic Parameters" table below External reference clock delay to internal clock 5 4 ns

External reference clock type/edge 3.3V LVTTL compatible, rising edge used External reference clock input Low level ≤ 0.8 V, High level ≥ 2.0 V, duty cycle: 45% - 55%

External reference clock maximum voltage -0.5 V up to +3.8 V (internally clamped to 3.3V, 100 mA max. clamping current)

Internal ADC clock output type 3.3 V LVTTL

Internal ADC clock output levels Low \leq 0.4 V, High \geq 2.4 V, TTL compatible

Internal ADC clock output drive strength Capable of driving 50 ohm load, maximum drive strength ±128 mA

software programmable Synchronization clock divider 2 up to [8k - 2] in steps of 2 ABA mode clock divider for slow clock software programmable 8 up to 524280 in steps of 8 3 MS/s

Minimum ADC clock before using Oversampling

ENOB (based on SINAD)	≥ 12.2 LSB	≥ 12.2 LSB	≥ 12.0 LSB	

Dynamic parameters are measured at ± 1 V input range (if no other range is stated) and 50Ω termination with the samplerate specified in the table. Measured parameters are averaged 20 times to get typical values. Test signal is a pure sine wave generated by a signal generator and a matching bandpass filter. Amplitude is >99% of FSR. SNR and RMS noise parameters may differ depending on the quality of the used PC. SNR = Signal to Noise Ratio, THD = Total Harmonic Distortion, SFDR = Spurious Free Dynamic Range, SINAD = Signal Noise and Distortion, ENOB = Effective Number of Bits.

Hardware block diagram

Order Information

The card is delivered with 256 MSample on-board memory and supports standard acquisition (Scope), FIFO acquisition (streaming), Multiple Recording, Gated Sampling, ABA mode and Timestamps. Operating system drivers for Windows/Linux 32 bit and 64 bit, examples for C/C++, LabVIEW (Windows), MATLAB (Windows and Linux), IVI, .NET, Delphi, Java, Python and a Base license of the oscilloscope software SBench 6 are included. Drivers for other 3rd party products like VEE or DASYLab may be available on request.

Adapter cables are not included. Please order separately!
